1 - introduction

data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data processing

data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data mining = non-trivial extraction of data mining tasks

1 - introduction

data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data mining = non-trivial extraction of implicit, previously unknown and potentially useful information from data input data mining = non-trivial extraction of implicit, previously unknown and potentially useful information information of informati

Ly prediction methods= use war to predict unknown or future val of other var Ly description methods= find human-interpretable patterns that describe the data at classification, regression, clustering, association rules ($A\rightarrow B$), anomaly detection
